The Peak® 150 steam turbine control is a low-cost, compact, digital control for single-valve or single-valve rack steam turbines. It provides convenient operator control and speed display from the front panel. It is housed in a watertight, and dust-tight, enclosure. A corrosion-resistant enclosure designed to meet NEMA 4X requirements is also available.

**Applications**

The Peak 150 digital control is designed to control a steam turbine driving a mechanical load. It provides tight control of speed (NEMA D) and includes an input for a 4–20 mA remote speed control signal, which can be used for a process-generated input to control the speed setting. Other features include dual speed control dynamics and overspeed trip test capabilities.

**Operation**

The operation of the control is simple. To start the turbine, the steam-supply valve must be opened (manually or by other means). When the turbine comes up to the user-determined idle speed, the Peak 150 system takes control of the turbine—the steam-supply valve can then be opened fully. The Peak 150 control includes circuitry for detecting the loss of either MPU signal—this circuitry is automatically overridden for starting.

The turbine can be accelerated from idle speed to minimum governor speed either automatically (by using the remote Idle/Min Gov contacts or by using the front panel start), or manually (by using the panel or remote Raise or Lower commands).

**Setpoint Adjustments**

**Manual Mode**

Turbine speed is adjusted solely by the front panel keys and the remote Raise and Lower discrete inputs. The Remote Speed setting analog input is ignored in this mode.

**Remote Speed Set Mode**

Turbine speed is determined by the Remote Speed Setting analog input. When the Remote Speed Setting Enable contact is closed and the turbine is at or above minimum governor speed, turbine speed will ramp from Min Gov Speed to the remote value at a user-defined rate. Once the speed setpoint output matches the setting of the Remote Speed Setting signal, the speed will change at a new user-defined rate for process control. If the Remote Speed Setting signal is disabled for any reason, the speed setpoint will remain at the last speed and the setpoint adjustment operates as it does in Manual Mode.

**Combination Mode**

This mode is similar to the Analog Remote Speed Set Mode, except that the speed demand generated by the discrete (front-panel and remote Raise and Lower contact inputs) and the analog Remote Speed Setting signal are compared for the highest value. This highest value is passed on as the commanded speed. If the Remote Speed Setting signal is disabled for any reason, control of the speed setpoint operates as it does in Manual Mode.

- Low-cost digital steam turbine control
- 16-bit, 12 MHz microprocessor
- Rugged NEMA 4 or NEMA-4X enclosure
- Front-mounted operator keypad and rpm/status indicators
- Easy setup and tuning using plug-in, hand-held terminal
- Modbus® communications capability
- Part of our Total Turbine Control System
**Programming Unit**

A small hand-held programmer (see illustration) connects to the Peak 150 to permit system configuration and tuning. System constants cannot be changed without this unit, so unauthorized changes are easily prevented by limiting access to the programmer.

**Critical Speed Avoidance**

To protect the turbine and skid from excessive vibration, a critical speed band can be defined by the user. While within this band, turbine speed will change at a fast rate (user-defined) and cannot be stopped within the band.

**Communications**

Serial communication using the Modbus® protocol is an option on the Peak 150. The transmission mode can be configured to be either RTU or ASCII mode. RS-232, RS-422, and RS-485 will all be supported through wiring to the proper terminals. Modbus, when purchased, permits communication with Programmable Logic Controllers or Distributive Control Systems. Speed, speed setpoint, alarm and shutdown conditions, and other pertinent control information will be reported on request from a master unit.

*—Modbus is a trademark of Schneider Automation Inc.

**Specifications**

**Inputs**

- Magnetic Pickup Inputs (2): Two identical inputs, high-signal-selected
  - Minimum input voltage 1 Vrms, minimum frequency 200 Hz, maximum frequency 15 kHz
- Analog Input (1): Remote Speed Setting signal
  - (4–20 mA or 1–5 Vdc, internal jumper selectable)
- Discrete Inputs (8): Remote (isolated, 5–28 Vdc)
  - Raise speed
  - Lower speed
  - Emergency stop
  - Alarm reset
  - Remote speed set enable
  - Start
  - Idle/minimum governor
  - Select high dynamics or overspeed test

**Outputs**

- Analog Outputs (2): Actual speed output (scalable, 4–20/0–1 mA)
  - Configurable readout (scalable, 4–20/0–1 mA)
- Options
  - Actual speed
  - Speed setpoint
  - Actuator output
  - Remote speed setpoint
  - Valve ramp value
- Actuator Output (1): 4–20 or 0–200 mA (internal jumper selectable)
- Relay Outputs (4): Internal jumpers provide choice of normally-open or normally-closed contacts
Contact ratings are:
- 2 A resistive @ 28 Vdc
- 0.3 A resistive @ 115 Vac

Shutdown (de-energizes or energizes for shutdown)
Alarm (de-energizes for alarm)
Configurable Relay #1
Configurable Relay #2

Options
- Alarm
- Trip output
- Shutdown
- Remote control
- Speed control
- MPU failure
- Overspeed trip
- Overspeed test
- Remote signal OK
- Speed switch #1
- Speed switch #2
- Hand valve #1
- Hand valve #2

Operator Control Panel
Keypad Switches (6)
Options
- Raise speed
- Lower speed
- Emergency trip
- Start
- Overspeed test
- Alarm reset

LED Indicators (6)
- Remote speed setting signal status
- Shutdown status
- MPU #1 status
- MPU #2 status
- CPU status
- Overspeed test status

Digital Display
- Five-digit LED speed display

Power
Input
- Models are available with these input power requirements:
  24 Vdc
  90–150 Vdc or 88–132 Vac, 47–63 Hz

Maximum power consumption, all models: 38 W

Environmental Specifications
- Operating Ambient Temperature: –25 to +60 °C (–13 to +140 °F)
- Storage Ambient Temperature: –40 to +85 °C (–40 to +185 °F)
- Humidity: Designed to meet US MIL-STD-810D, Method 507.2, Procedure II, induced, non-hazardous, cycle 5 (fifteen 24-hour cycles, varying 19–75% humidity, over 33–63 °C)
- Vibration: US MIL-STD-167, Type 1
- North American Regulatory Compliance: CSA Listed for Class I, Division 2, Groups A, B, C, & D (CSA certificate number 2474728)

Dimensions
- Width: 483 mm (19 inches)
- Height: 310 mm (12.2 inches)
- Depth: 105 mm (4.1 inches)
